

SOSP Localization Spectrum

What to keep global. What to redesign locally. Where most FDI operating models draw the line in the wrong place.

KEY PRINCIPLE
 Localization isn't translation. It's redesign of the specific operating model elements that don't transfer across contexts.
The mistake isn't localizing too much. It's localizing the wrong things and leaving the structural elements unchanged.

DESIGN DECISION POINT

⚠ **Most FDI companies draw this line here.**
It should be further right, more elements need local adaptation than most imported operating models assume.

KEEP GLOBAL <i>Works across markets Do not change</i>	Brand Standards Visual identity, naming, brand voice: consistent everywhere.	Financial Controls Reporting frameworks, audit requirements, budget approval thresholds.	Core Product / Service Specs What you deliver and at what quality baseline: non-negotiable.	Compliance Frameworks Legal, regulatory, and ethical requirements that apply globally.	Strategic KPIs The top-line metrics the business is accountable for at group level.

▼ **The divide most imported operating models get wrong** ▼

ADAPT LOCALLY <i>Must be redesigned for Vietnam context</i>	>> Governance Style How decisions are made: consensus, speed, hierarchy involvement.	>> Decision Speed Norms Timeline expectations built into SOPs and review cadences.	>> Role Authority What acting without direction looks like, explicit scope per role.	>> Communication Structure How information flows up, down, and across the team.	>> Performance Feedback Mechanisms that actually create accountability in this context.
